

Cloudspital Health Kiosk Management Platform

Interview Project Notes · Junior Software Developer Intern

Project Overview

A web-based SaaS dashboard used by hospitals and administrators to monitor Cloudspital's deployed health kiosks across different locations. The dashboard aligns with Cloudspital's Health Kiosk and telemedicine offerings.

The dashboard allows hospitals to:

- Register health kiosks
- View patient screening reports
- Manage doctors
- View analytics
- Monitor kiosk status
- Schedule telemedicine consultations
- Track device health
- Manage hospital users

Simple Architecture

Data flows from the patient at the kiosk through the cloud stack to hospital staff:

Patient → Health Kiosk → Cloud API → Cloudspital Backend → MySQL → Admin Dashboard → Hospital Admin / Doctor

Modules

1 Authentication

- Admin Login
- Hospital Login
- Role Based Access
- Doctor Login
- JWT Authentication

2 Health Kiosk Dashboard

- Online kiosks
- Battery status
- Last sync
- Offline kiosks
- Internet connectivity
- Location

3 Patient Reports

- Health screening history
- Blood Pressure
- Pulse
- Blood Sugar (where available)
- BMI
- Temperature
- SpO2
- Download PDF

These are consistent with the company's health screening capabilities.

4 Telemedicine

- Patient books consultation
- Doctor opens report
- Prescription generated
- Doctor receives notification
- Starts video consultation

Cloudspital highlights integrated telemedicine as one of its core solutions.

5 Analytics Dashboard

- Total Patients
- High Risk Patients
- Kiosk Usage
- Daily Screenings
- Most Common Diseases
- Monthly Reports

Your Role

Instead of saying "I built the whole platform," use a realistic intern framing:

"I worked on frontend features and API integration for the Health Kiosk Management Dashboard. My mentor assigned modules, and I implemented UI components, integrated REST APIs, fixed bugs, improved responsiveness, and participated in testing."

Daily Workflow

Example Feature — Kiosk Status Screen

Screen Fields

- Device ID
- Location
- Internet Status
- Battery
- Last Updated
- Temperature
- Firmware Version

Dashboard Shows

Hospital / Kiosk	Status	Battery / Sync
Patna AIIMS	Online	98% - 2 minutes ago
Railway Hospital	Offline	Last Sync 10 min ago

Example API

```
GET /api/kiosks
[{"id":12, "name":"AIIMS Patna", "status":"Online", "battery":95}]
```

Database Tables

Hospitals	Doctors	Patients	Kiosks	Appointments
HealthReports	Users	Notifications		AuditLogs

Real Bug Story

Q: Tell me about one bug.

"The dashboard wasn't updating kiosk status correctly because the frontend cached older API responses. I fixed it by refreshing the data after every successful API request and displaying the last synchronization time so users knew how recent the information was."

Biggest Challenge

Q: Biggest challenge?

"One dashboard became slow because hundreds of kiosks were displayed at once. We introduced pagination and server-side filtering so users could search by hospital or location instead of loading everything at once."

What You Learned

- REST API Integration
- Responsive Design
- Component Reusability
- Code Reviews
- Git Workflow
- Debugging
- Professional Development Workflow
- Healthcare Domain Knowledge

If Interviewer Asks

What exactly is Cloudspital?

"Cloudspital is a MedTech company focused on digital healthcare automation. It develops health kiosks, telemedicine solutions, AI-assisted screening systems, and connected healthcare platforms that help hospitals and healthcare providers deliver services more efficiently."

What is the Health Kiosk?

"It's a point-of-care device that performs health screening, supports telemedicine, and uploads patient data to a cloud platform where doctors can review reports and conduct remote consultations."

Why is it SaaS?

"Because hospitals access the platform through a web application without installing software locally. Cloudspital manages the application centrally, and multiple organizations can use the same platform with isolated data."

Technology Choices

Why React?	Why Node.js?	Why MySQL?
• Reusable Components • Fast UI • Easy API Integration • Good State Management	• Asynchronous APIs • Fast Development • JavaScript across frontend and backend • Easy REST API Development	• Structured healthcare data • Relationships between hospitals, patients, doctors, appointments, and reports • Reliable transactions
